

2-3-4 Trees and Red-Black Trees

erm

204

2-3-4 Trees Revealed

- **Nodes** store 1, 2, or 3 keys and have **2, 3, or 4 children**, respectively
- All **leaves** have the **same depth**

$$\frac{1}{2} \log(N+1) \leq \text{height} \leq \log(N+1)$$

erm

205

2-3-4 Tree Nodes

- Introduction of nodes with more than 1 key, and more than 2 children

2-node:

- same as a binary node

3-node:

- 2 keys, 3 links

4-node:

- 3 keys, 4 links

erm

206

Why 2-3-4?

- Why not minimize height by maximizing children in a “d-tree”?
- Let each node have d children so that we get $O(\log_d N)$ search time! Right?

- That means if $d = N^{1/2}$, we get a height of 2
- However, searching out the correct child on each level requires $O(\log N^{1/2})$ by binary search
- $2 \log N^{1/2} = O(\log N)$ which is not as good as we had hoped for!
- 2-3-4-trees will **guarantee $O(\log N)$ height** using only 2, 3, or 4 children per node

erm

207

Insertion into 2-3-4 Trees

- Insert the **new key** at the **lowest internal node reached** in the search

- 2-node** becomes **3-node**

- 3-node** becomes **4-node**

- What about a **4-node**?
 - We can't insert another key!

erm

208

Top Down Insertion

- In our way down the tree, whenever we reach a **4-node**, we **break it up** into two **2-nodes**, and move the middle element up into the parent node

- Now we can perform the insertion using one of the previous two cases

- Since we follow this method from the root down to the leaf, it is called **top down insertion**

erm

209

Splitting the Tree

As we travel down the tree, if we encounter any **4-node** we will break it up into **2-nodes**. This guarantees that we will never have the problem of inserting the middle element of a former **4-node** into its parent **4-node**.

erm

210

erm

211

erm

212

Time Complexity of Insertion in 2-3-4 Trees

Time complexity:

- A search visits $O(\log N)$ nodes
- An insertion requires $O(\log N)$ node splits
- Each node split takes constant time
- Hence, operations *Search* and *Insert* each take time $O(\log N)$

Notes:

- Instead of doing splits top-down, we can perform them bottom-up starting at the insertion node, and only when needed. This is called *bottom-up insertion*.
- A deletion can be performed by *fusing* nodes (inverse of splitting), and takes $O(\log N)$ time

erm

213

Beyond 2-3-4 Trees

What do we know about 2-3-4 Trees?

- Balanced
- $O(\log N)$ search time
- Different node structures

Can we get 2-3-4 tree advantages in a binary tree format???

Welcome to the world of Red-Black Trees!!!

erm

214

Red-Black Tree

A **red-black tree** is a **binary search tree** with the following properties:

- edges are colored **red** or **black**
- **no two consecutive red edges** on any root-leaf path
- **same number of black edges** on any root-leaf path (= **black height** of the tree)
- **edges connecting leaves are black**

erm

215

2-3-4 Tree Evolution

Note how **2-3-4 trees** relate to **red-black trees**

2-3-4

Red-Black

Now we see **red-black trees** are just a way of representing 2-3-4 trees!

erm

216

More **Red-Black Tree** Properties

N # of internal nodes
L # leaves ($= N + 1$)
H height
B black height

Property 1: $2^B \leq N + 1 \leq 4^B$

Property 2: $\frac{1}{2} \log(N + 1) \leq B \leq \log(N + 1)$

Property 3: $\log(N + 1) \leq H \leq 2 \log(N + 1)$

This implies that searches take time $O(\log N)$!

erm

217

Insertion into **Red-Black Trees**

1. Perform a standard search to find the leaf where the key should be added
2. Replace the leaf with an internal node with the new key
3. Color the incoming edge of the new node **red**
4. Add two new leaves, and color their incoming edges black
5. If the parent had an incoming **red** edge, we now have two consecutive **red** edges! We must reorganize tree to remove that violation. What must be done depends on the sibling of the parent.

erm

218

Insertion - Plain and Simple

Let:

○ n be the new node
○ p be its parent
○ g be its grandparent

Case 1: Incoming edge of p is black

No violation

STOP!

Pretty easy, huh?

Well... it gets messier...

erm

219

Restructuring

Case 2: Incoming edge of **p** is **red**, and its sibling is black

We call this a “**right rotation**”

- No further work on tree is necessary
- Inorder remains unchanged
- Tree becomes more balanced
- No two consecutive **red** edges!

erm

220

More Rotations

Similar to a right rotation, we can do a “**left rotation**”...

Simple, huh?

erm

221

Double Rotations

What if the new node is between its parent and grandparent in the inorder sequence?

We must perform a “**double rotation**”
(which is no more difficult than a “single” one)

This would be called a
“**left-right double rotation**”

erm

222

Last of the Rotations

And this would be called a
“**right-left double rotation**”

erm

223

Bottom-Up Rebalancing

Case 3: Incoming edge of **p** is **red** and its sibling is also **red**

- We call this a “**promotion**”
- Note how the black depth remains unchanged for all of the descendants of **g**
- This process will continue upward beyond **g** if necessary: rename **g** as **n** and repeat.

erm

224

Summary of Insertion

- If **two red edges** are present, we do either
 - a **restructuring** (with a simple or double rotation) and **stop**, or
 - a **promotion** and **continue**
- A **restructuring** takes **constant time** and is performed at most once. It reorganizes an off-balanced section of the tree.
- **Promotions** may continue up the tree and are executed **$O(\log N)$ times**.
- The **time complexity** of an insertion is **$O(\log N)$** .

erm

225

An Example

Start by inserting “REDSOX” into an empty tree

Now, let's insert “C U B S”...

erm

226

A Cool Example

erm

227

[illegible]

Oh No!

What should we do?

Double Rotation

Rotation

What now?

Rotation

A diagram showing a node **U** at the top, which branches into two nodes, **S** and **X**, below it. The connections between **U** and **S**, and between **U** and **X**, are highlighted with red lines. Above node **U**, there are two other nodes, **O** and **U**, connected by black lines to the main structure.
